

Installation Instructions for the DHM6 Dual Headlight Mount on a Kawasaki Mean Streak

Remove the front bezel from the headlight and disconnect the wire plug from the headlight and all the quick disconnects. Remove all the wires from the headlight housing.

Remove the Phillips head screws that hold the turn signal retention plate to the headlight mount assembly and remove the nuts under the triple tree to remove the headlight assembly as shown in Picture A

Picture A

Detach the brake line from the front of the triple tree and move to the side and mount the DHM6 on top of the turn signal retention plate and to the triple tree with two 1/4" bolts as shown in Picture B. Carriage bolts work well but any can be used.

Picture B

Attach the lights to the DHM6 as shown in Picture C.

Picture C

Undo the wire harness and separate the headlight wires from the rest and bring them forward to connect power to the headlights. After figuring out how to reroute the rest of the wires, reconnect all the quick disconnects and wrap them with electrical tape and wire tie them under the top triple tree. Wrap the remaining wires in electrical tape and/or wire loom and tuck any wires that don't need to show behind the tank.
